The lightweight board for heavy loads

Wasa stands for endurance, speed and versatility: For over 55 years the company has combined know-how and the growing requirements for quality and precision in its daily work. Wasa has always set itself apart from the rest of the market with its broad range of boards. For that reason alone, concrete plants all over the world place their trust in Wasa's products today.

Inspired by steel reinforced concrete construction, the latest innovation from Wasa impresses with steel reinforcement struts and a unique honeycomb structure.

Wasa knows its customers' exact wishes, and the family-run company constantly invests in research and development in order to be able to meet them tomorrow, too. In focus: extreme performance and high profitability.

Around 120 people work every day with a passion to make sure that Wasa remains what it has become over the past few decades: one of the global market leaders in production boards.

Wasa provides its customers with the right production board for their individual requirements - whether made of pine or larch wood, with a polyurethane coating or solid plastic boards. In addition to that, Wasa proves its broad expertise as a supplier to the concrete block industry with polyurethane and silicone moulds

for wetcast production as well as a comprehensive range of accessories for hermetic presses.

The Wasa Tecboard®

Wasa's latest high-end board was presented to the public for the first time in April at the bauma in Munich. Thanks to the interaction of steel reinforcing struts and a unique honeycomb structure, the Wasa Tecboard is particularly suitable for heavy concrete products and those that are sensitive to bending.

The hollow spaces in the honeycomb structure not only provide room for the installation of RFID chips, which ensure permanent traceability of the produced concrete goods, they also transform the Wasa Tecboard into a genuine lightweight - and thus into a very efficient production board.

The key properties of the new Wasa Tecboard

- Low board weight thanks to innovative honeycomb structure
- Extremely rigid thanks to additional steel reinforcement
- Recyclable and sustainable
- RFID chips can easily be installed in the honeycomb
